

Proposed #ifdef change to em

Source: <http://unix.derkeiler.com/Mailing-Lists/FreeBSD/net/2007-10/msg00301.html>

-

I have found that the FAST interrupt handling is implicated in the watchdog resets that I have seen.

What I plan to do is revert to the way 6.2 had things, meaning that FAST interrupts will be available but defined off by default.

I wanted to know if anyone has an issue with this. And more importantly, I have personally not seen this problem on 7, but I could set up #ifdef's in that driver to be the same way.

What does everyone think?

Jack
