It worked. Now it does not work. Someone(tm) made the change.
We have the CVS. Isn't there such thing as responsibility for changes?
A dichotomy will show us who did the change :-)

Given that the idea is that we dont expect to get to this anytime soon, we welcome the person who does the analysis for us so that we might be able to fix this quicker (if possible with all the changes involved).

The revision 1.120 of src/sbin/ifconfig broke this:
"cvs update -D '2006/07/09 06:00:00'" gives us ifconfig binary what works and "cvs update -D '2006/07/10 00:00:00'" gives one that fails. The commit deals with interface cloning.

Now I'm looking for the fix. This is POLA issue and such regressions should not be tolerated, there are already too many of them.
