I've noticed a lot of new users that come in here post a technical question and haven't read the Handbook yet.

I think we need to have more conversations about our newbie experiences so when a new person joins the mailing list he can see what the list is all about. I know that it happens atleast once a week someone can't start X windows or someone can't load a port because they're not root, or they simply don't know about the resolve.conf feature of FreeBSD 5.x.

Well I'll start the conversation with my quest for a small mother board for a router. I really want something with USB. I'm thinking the M-ITX format board from EPIA. I've also looked at SBC's but they all have this back plan adaptor and I really. want something that can be self contained and small. I'm even looking at the Jetway board with a DOC slot. Disk on Chip. sounds so cool. And would be great for a freevo unit as well.

Let's talk about our projects as well.
