Hello,

I have got a problem with FreeBSD and my laptop, I am trying to install FreeBSD 5.3-RELEASE on it but i get the following errors ata1-slave: FAILURE – ATAPI_IDENTIFY timed out also it takes alot of time to load uhub1. I am trying to dualboot it with Windows XP but I dont think thats a problem because I installed it on my home computer without any problems (also dualbooted and the same FreeBSD cd).

After searching though the mailing list archives I tried the following: At the boot prompt of the FreeBSD cd I went into the loader prompt and did typed the following "set hw.ata.atapi_dma="0"" after that I typed "boot" to continue booting up the installation. Yet it still hangs at the same point.

I was hoping someone could help me getting it to boot so I can install it on my laptop.

Thanks in advance,

Roeland
