Hello everybody,

I am writing here because I am a little confused. I would want to give an access to someone on my FreeBSD 5.3-RELEASE BOX but I want the environment to be restricted to the home directory. So I am looking for a documentation for making chroot on FreeBSD but I can't find it. Maybe I am looking in a bad way ;(.

I have heard about jails but the problem is that I have only one IP and I don't want to make the world only for a shell.

So, would somebody give me some advices/links/issues for this problem ?

Thank you for your answers

Best regards

Ptitoliv
