I gotta question. I am contemplating buying the new AMD Opteron for a newer FreeBSD server. I am certain because of it's x86 compatibility running FBSD won't be a problem, and I know that there is a 64Bit Apache underways, but is there any 64 bit MySQL Server on the way? Or does MySQL compile with that option? I am certain it can be built with Hyper Threading, but can that help performance on a single 64 bit CPU? Please help! (before I invest :-))
