Not sure if this is best suited for -performance or -ipfw, so I'll try you folks first.

Before I figure out a way to fairly benchmark it, has anybody done benchmarks on IPFW or IPFW2 in FreeBSD 4.x and/or FreeBSD 5.x? I couldn't find anything insightful in any of the list archives. I am looking at designing a firewalling application and would like to have a rough idea of how much stress I can expect to get out of FreeBSD before I even investigate the platform any further.
