I probably was not 100% clear when I asked the question. Sorry. I am looking for test that would tell me how will server perform in the field on WAN.

Webstone is a bit naive about benchmarking. It allows comparison of server scores, however the fact that a particular OS/server combination scores higher does not guarantee that it will have higher throughput in real life situation.

I scanned briefly through Web Polygraph's documentation and it seems like more powerful tool, but I could not find how to emulate large delays and packet loss common for WANs.

IS.
