So, if both systems use `gettimeofday`, then slow may be somewhere else.

Errrr... I think David might have meant that the original poster should simply set `kern.timecounter.hardware` to 'TSC', not `i8254` or something else. This would not change whether MySQL uses `gettimeofday()` or not, it would simply change the in-kernel method of obtaining the actual time of day - at least that's how I understand it :)

G'luck,
Peter

Err, I just wanted to know the best performance current FreeBSD can achieve. The timer problem had already been discussed several times in the list, I don't want to repeat it here.
