As I reported a year ago – problem occurred in 5.1.6 (maybe 5.1.5 – I never tried it, I jumped from 5.1.4 to 5.1.6 or newer). Can somebody look at PHP sources of those two versions and find the "bad change"?

Handily I have 5.1.4 sources right next to my copy of trunk PHP5; main/fopen\_wrappers.c `php_check_specific_open_basedir()` is about half the size there, and doesn't perform any `readlink()` calls, so it's probably vulnerable to escaping the basedir using symlinks, but considerably faster.
