Kris, as i said, i made portupgrade -faP ...and in update process i saw that many ports upgraded. I don't why old version become as current version. Now i've installed compat6x (thanx Stefan Lambrev) -> it's works...but anyway now i will try fix pkgdb and reinstall all necessary ports.

Hi! The first of all i want felicitate FreeBSD development team and all

FBSD

community with 7.0 come-out.

Ok, the question is not about performance, but anyway maybe you have some ideas how to solve problem in short time - i don't want rebuild all needed packages :)

This morning i decided to upgrade one of the my boxes from 6.3 to 7.0

using

<http://www.daemonology.net/blog/2007-11-11-freebsd-major-version-upgrade.htm>

I script not native freebsd-update().

Scenario:

fetch <http://people.freebsd.org/~cperciva/freebsd-update-upgrade.tgz>

fetch <http://people.freebsd.org/~cperciva/freebsd-update-upgrade.tgz.asc>

RE: Upgrade from 6.3 to 7.0: Result ->Shared object not found :)

RE: Upgrade from 6.3 to 7.0: Result ->Shared object not found :)

```
# gpg --verify freebsd-update-upgrade.tgz.asc freebsd-update-upgrade.tgz
# tar -xf freebsd-update-upgrade.tgz
# sh freebsd-update.sh -f freebsd-update.conf -r 7.0-RELEASE upgrade
# sh freebsd-update.sh -f freebsd-update.conf install
# shutdown -r now
# sh freebsd-update.sh -f freebsd-update.conf install
# portupgrade -faP
# sh freebsd-update.sh -f freebsd-update.conf install
# shutdown -r now
```

All goes fine till second reboot.

After reboot, i couldn't logon to remote box, because default shell is

bash,

and i got error on SSH login:

```
/libexec/ld-elf.so.1: Shared object "libncurses.so.6" not found, required
```

by

```
"-bash"
```

If the portupgrade -faP completed successfully and your bash was installed from ports then it should have been rebuilt. If you have non-port 6.x software installed then you need to add the compat6x port to keep it running.

Kris
