I have a freebsd 4.4.1 workstation on my LAN configured to obtain it's IP address through DHCP. The proxy server is a Microsoft Proxy Server and it will not allow the freebsd machine to access the Internet. Only windows workstations are able to connect to the Internet. In all the documentation that I have read on PPPoE it explains how to connect to ADSL or ATM through a second nic. Surely bsd will connect to the outside world just by knowing the gateway address? Do I have to still configure ppp.conf and if so what do I put in it? If somebody could just point me towards some documentation I'd be most grateful.
Thank you.
