I've done what you said and could rebuild some packages including gettext and pkgconfig but the previous error message remains for applications running ld-elf. For example gkrellm - which I could rebuild easily - still aborts at runtime with "ld-elf.so.1 : Shared object libintl.so.4 not found". There is no way to install gkrellm2 (because of pango complaining "ld-elf.so.1 : /usr/X11R6/lib/libfontconfig.so.1: Undefined symbol "FT_Get_BDF_Property"). Mozilla does not work nor build anew either. Mozilla-devel aborts during configure warning it does not find libraries and asking to setenv PKG_CONFIG_PATH, which does not help.

The other applications seem to work well.
I think also that I made errors with pkgdb -F .

Is there a way to fix this ?

Do you think that a portupgrade of all packages could help ?
How would I recover the correct dependency lists if I corrupted them with pkgdb -F?

In the worse case how could I get rid of all my ports and pkgs and rebuild them from scratch without messing the system ?
