I've been massaging UberMon for SuperKaramba for my FreeBSD systems.

I'd like to be able to run a command that will yield which X window system is installed and what version.

I've done it with something like `startx -- --version`, but this is problematic if X windows is running (which is the scenario I need it to work in).

Even then, I'd have to `grep` for "XFree86 Version" so it isn't a general solution that would work for systems already switched to `x-org`.

Any deas?
