To: "FreeBSD" <freebsd-questions@freebsd.org>

I've just installed apsfiler on the latest FreeBSD 5.3 to print with my epson stylus color 640 (driver eps640lp.upp) following both the handbook chapter on printing & an article in freebsd-diary.org.

But:

1) If I – running apsfiler SETUP – use the "T"(est) option, the PC tiringly, after an unbearable couple of minutes or so, starts printing a first row of squares of the test picture only, then seems to hang, emitting from time to time a (useless) sound. At this point it's better to stop CTRL+Del.

2) If I try to print via lpr -Plp plaintestfile the log under /var/spool/lpd/lp says

```
"/usr/local/etc/apsfiler/basedir/bin/apsfiler: cannot open /var/spool/lpd/lp/lock:  
Permission denied"
```

and doesn't print anything.

Please help.

Vittorio
