

freebsd-questions: Trying to use FreeBSD as a home router, how to setup VOIP to pass through?

Trying to use FreeBSD as a home router, how to setup VOIP to pass through?

My home network is currently setup with a lowend router from my phone company. Its not very good and i have my only phone service through it using VOIP. I've managed to get the rest of my network (3 computers) behind the freebsd machine (computer 4). The problem is that i'd like to move the voip router behind the freebsd machine. I'm assuming i need to do some sort of port forwarding to pull this off. I've done some googling but can't seem to find good documentation on what ports to forward or how one would do port forwarding to another host.

I'm using FreeBSD 5.4 stable (week or two old), ipfw and natd with a divert rule in place and practically no other configuration. Does anyone have any resources on forwarding voip traffic?

My long term goal is to get voip working and then setup an ip 6 tunnel with HE.

I am not currently subscribed to questions so please CC me in replies.

Here's a rough idea what my network is like

```
cable modem
+
+
voip router
+
+
freebsd machine
+++
pc mac mac
```

Everything is setup wth IP4 at the moment.
