The first error is in line 251.

```
#include <ruby.h>
in file core.c cannot find the file ruby.h.
The file ruby.h is present in
/usr/ports/www/elinks/work/elinks-0.11.1/src/scripting/ruby,
together with the file core.c.
But this file is included in line 19 of file core.c.
The last one is attached too.
There is no ruby.h in /usr/include, indeed.
```

Any ideas?

Unfortunately this application stupidly hides its compilation command behind a super-awesome fake compilation message:

```
[ [27mCC] src/scripting/ruby/core.o
```

which means it's impossible to tell what it did and what went wrong. Someone will have to figure out what the heck it's actually doing here. Try talking to the maintainer.

Kris
