On Mar 29, 2007, at 7:10 PM, Jonathan Horne wrote:

to test the behavior of both buildworld and updating ports with portupgrade, i started my project over, and rebuilt my jail host as FreeBSD 6.2-RELEASE. within this, i configured 2 jails, and installed various ports that i run on other production systems (actually, i installed from a ports tree that i cvsup'd with date 2007.01.01.01.01.01, so that i could legitimately test upgrading to todays copy). today, i cvsup'd the sources on the host to 6.2-RELEASE-p3, and built world. i installed world, and rebooted, but did not update either of the jails, just to see what would happen with the host running p3, and the jails running RELEASE. to my surprise, both jails were running p3 when the host came back up.

so what am i missing about jail theory here? how did that kernel get into my jails if i did not install it?

Jails all run on the base kernel

what about the rest of userland?

That needs to be updated per jail. I use a master jail I nullfs mount so I just ave to update userland once but if major etc changes happen still have to do that in each

Chad

at what version should i expect that to be at, at this point?

thanks,
jonathan
