

normal mount points

Source: <http://unix.derkeiler.com/Mailing-Lists/FreeBSD/questions/2007-04/msg02100.html>

I ran the df command last night to check slice sizes in anticipation of doing some backup and eventual transfer to a new machine.

The output gave me not just normal slices that were created at install but also three additional (mount points?)

/proc

/net

/host

The machine is a simple web server and print server with little else on it. Can some explain to me (or point me to) an explanation of mount points?

Thanks,
Graham/
