OK, so you in fact did not just do a direct install from the iso and nothing else :) One of those other steps must have gone wrong, e.g. you installed packages from the wrong package set.

Seems so, but I do not know when because I never touched anything else than something with a 7 in it. And xemacs compiled originally just as an example.

But right now portupgrade -fa is working - I hope that solves the problems I'm having.

Any way how to find out if xemacs 21.5 is in any of the ports? Because the unicode-support in 21.4 sucks I heard from one of the core developers&

And if it's only in current - is there any way to just install that one package from current or do I have to switch completely?

Niels
