

rc.d/named

Source: <http://unix.derkeiler.com/Mailing-Lists/FreeBSD/questions/2008-06/msg00363.html>

I have quite a bit of trouble with the /etc/rc.d/named script. The source of the biggest issue was the rc_run_command was not issuing the run command with "/usr/sbin/named". It was just running the arguments w/o the executable.

e.g. -t /var/named vs. /usr/sbin/named -t /var/named

I have the stock /etc/defaults/rc.conf, and the only thin in /etc/rc.conf related to named is a correction to the chroot directory... For the time being that issue has been resolve by hacking the rc.conf to issue the executable where the flags are specified. However, when issuing /etc/rc.d/named I get:

named not running? (check /var/run/named/pid).

/var/run/named/pid contains the correct PID, and has permissions:

lrwxr-xr-x 1 root bind

Anyone else having trouble with this? None of the other init scripts are having problems.

TIA,
Casey
