Below is the output of /var/log/maillog. I'm trying to send an email from the "irc" account on the server, to "staff@xxxxxxxx". I think maybe sendmail is getting confused because the hostname of the FreeBSD box is also "domain.tld", the same host I'm trying to send outgoing mail to.

Yes, that is the problem. In order for you to send mail out to domain.tld, sendmail must not think that it is configured to handle domain.tld locally. I would recommend changing your hostname to something like server1.domain.tld and making sure you don't have the domain 'domain.tld' listed alone in your sendmail config files.

Regards,

Mark
