Trying to umount a file system, and I get:

```
umount /vm
umount: unmount of /vm failed: Device busy
```

using lsof, I find nothing open on the file system:

```
pluto# lsof | grep vm
lsof 6548 root txt VREG 13,131077 19308 157977 /usr/lib/libkvm.so.2
upclient 39379 root txt VREG 13,131077 19308 157977 /usr/lib/libkvm.so.2
```

I'm the only one logged into the machine, and I'm in on / ...

and process wise, the machine is silent:

```
pluto# ps aux

So why won't it let me umount the drive? :(

Thanks ...
