Hello,

I have the latest apache2 port installed and I can start the server by manually issuing an 'apachectl startssl' command. I have added the apache2ssl_enable="YES" to my /etc/rc.conf file, yet on a server reboot the apache server does not start.

Is there something I could be missing? the httpd-error.log does not report any errors. Is there another log file I could check?

OS is FreeBSD 4.9-RELEASE FreeBSD

Thanks,
Roger
