I have a firewall running on a PentiumPro with 512MB ram. My internet connection is Cable (wanadoo).

I was on 4.9 Stable p3.

Last Sunday I've cvspped my sources to 4.10p2 and did a make buildworld cycle as described in the freesbd handbook. No errors occurred during compile or install actions.

I use no optimizing in the make.conf (No -O3....)

After rebooting this server came up, nothing special..it made connection to the internet and all was fine..

But since then the connection is very very slow.

My normal ping times are ~25ms now they are 1000ms. My download speeds also have dropped dramaticly.

I've rebooted and fired up the 4.9 kernel and all problem were solved!

So I can rule out that it has anything to do with my ipf.rules...Or??

I cannot find anything on the web regarding Ipfilter and 4.10 behaving badly..maybe you all have some ideas?

Info:

```
[u@controversy Henk# uname -v
```

```
FreeBSD 4.10-RELEASE-p2 #1: Tue Aug 31 18:32:41 CEST 2004
```

```
