On my laptop running 6.2-PRERELEASE the drives always mount dirty, which suggests that they are not being shutdown clean; however the machine always syncs the disks and switches itself off after a 'shutdown -p now', and so I'm not sure what it could be.

Has anyone else seen this?

I haven't seen any other reports of this. Have you tried running a "fsck -f" on the drives? It's possible there's a latent error that isn't being fixed by bgfsck.

I thought I did; I'll try again now and see what happens. It's strange though because it's every partition.

Joe
