Yours makes the third report of this that I know of ... one of us is running 6.2-RC, one 6.1-RELEASE ... what version are you running? I get the same 'hang' also ...

Have you enabled DDB in your kernel? Also, have you enabled the dumpdev settings in /etc/rc.conf?

Dear All,

I need some help on the problem below.

The following error occurs in my FreeBSD 6.1 (Dell 420) server:

Sleeping thread (tid 540242, pid 32378) owns a non-sleepable lock
panic: sleeping thread

Cannot dump. No dump device defined.

Re: Sleepy thread – Kernel Panic

Automatic reboot in 15 seconds – press a key on the console to abort. Rebooting

However, it does not reboot and simply hangs.

I have tried commenting the "options PROCFS" which seemed to work for 2 says. However on the 3rd day, the same problem surfaced again.

I probably think that it is a hardware problem. Does anybody have some ideas regarding this problem.

Dear Marc,

I apologize for the delay in this email.

I am using FreeBSD 6.1 (i386) with SMP on a dell 420. I have not enabled DDB in my kernel. I also don't have dumpdev in my rc.conf too.

What will be the implications of having those options in the Kernel and rc.conf?

However, I doubt that this could be some hardware problem. Please shed some light on this?
