Creating the /usr/X11R6 -> /usr/local symlink is necessary, even on a
system with xorg 7.2 installed from scratch. The presence of that
symlink will stop the xorg-libraries port whinging at you.

I did a clean (re)install of current and upgraded to gcc 4.2 and then
installed xorg 7.1 and kbase afterwards. I did not encounter any
problems running X, I haven't symlinked /usr/X11R6 to /usr/local. I
haven't ssh into the machine from outside though but X appears to
work locally.
