- 

Folks,

I have old PC (P1 75MHz, 64Mb RAM, xl and fxp network interface, internet connection via pppoe), which was loaded with 4.11-STABLE and served as internet gateway plus hold samba and squid. I decided to turn it into wireless access point and upgraded it to 6.2-STABLE. Samba speed dropped from 2mb/s to 900kb/s. I tried GENERIC and custom kernels, tried to play with polling, but there was no speed increase. I tried to install netbsd 3.1 on the same hardware and got 2mb/s again (without additional tuning), but I would prefer to stay with freebsd. Could you please tell me what options should I try to increase network performance? Please let me know if I should supply more information about my setup.

Thanks in advance for your help.  
Kirill.
