

apache core dump signal 11 after portupgrade from 1.3.37 to 1.3.39

Source: <http://unix.derkeiler.com/Mailing-Lists/FreeBSD/stable/2007-09/msg00204.html>

- *From:* David Gessel <gessel@xxxxxxxxxxxxxxxxxxxxx>

-

I did a portupgrade -ra to 1.3.39 and after a reboot found apache not running. I've poked around and haven't found much that's useful - signal 11 being sometimes associated with memory errors (a memory test comes up fine, though it is unlikely that an update would crack the RAM). Otherwise few hints. Any suggestions would be much appreciated.

The key details are - pkg_version -v -L = showed (among other updates simultaneously applied as listed below) that:

apache+mod_ssl-1.3.37+2.8.28 < needs updating (port has 1.3.39+2.8.30)

After rebooting I get in /var/log/messages only

kernel: pid 1127 (httpd), uid 0: exited on signal 11 (core dumped)

and in /var/log/httpd-error.log only

[info] mod_unique_id: using ip addr xxx.xxx.xxx.xxx [correct localhost address]

every time I "apachectl start" (and after setting apache.config log level to "debug")

The same portupgrade -ra also updated the following (and then a long day of compiling ensued)

- note that the openssl package error is a problem I haven't been able to fix since screwing up an openssl install effort (overwrite_base somehow becoming a package rather than a directive). OpenSSL has worked fine on the system and currently works, viz:

```
# openssl
```

```
OpenSSL> version
```

```
OpenSSL 0.9.8e 23 Feb 2007
```

Though I'd love to fix the invalid port reference too.

```
pkg_version -v -L =
```

```
apache+mod_ssl-1.3.37+2.8.28 < needs updating (port has 1.3.39+2.8.30)
```

```
