Hi ,

I have one N4000 box (which is in production) .
Business data is on external RAID box with SCSI i/f.

We bought a RP7410 with Hitachi Raid Box . This is in development so far .

WE are going to switch the CPU box alone .
Means RP7410 will be disconnected from the Hitachi Raid Box and will be connected to a new SAN . (This is no problem)

N4000 (without the external RAID box- SCSI) will be connected to the new Hitachi Raid box (with Fiber)

.
(with a addisional HP Fiber card) .

N4000 will be development and disaster recovery box for the rp7410 .

Questions is :

Is it possible to use make_recovery tape from RP7410 and restore it to N4000 . ?

This is because rp7410 has all tuning /changes for running the new version of our application where as N4000 has tuned only for the older application version .

Or does it make sense to rebuild the box and configure manually ?

Thanks
Vinod
