Query :

I am in process of making depots/packages for Oracle.

The basic deport for Oracle Binaries have been made.

(i.e I basically copy the Oracle Home Directory from CD to the destination box)

I have a sql script to create a database on this installation.

I want to make this as automated as possible with the installation team to run this script manually.

That is after the oracle is installed the package installation should continue to install the database.

I was also thinking since our database is not customized can I create the database as well before I package the Oracle binary to include this database related files along..

Or ..Is there a better way to do this entire operation.

Thankyou Robin Marquis for the response..Here is the summary :

Even better – use swpackage to create a depot which you can then install with swinstall completely unattended. You'll need to write a psf file which will describe the media and the install scripts then swpackage will create everything you need.

Its all fairly easy to follow from the manual pages,

HP-UX-Admin: [HPADM] [Summary] Packaging Query

start with swpackage. Your installation script then becomes the postinstall or the configure script. I install most of my 3rd party software this way. Oh and you'll need to have ignite installed on the host you make your packages on, for the commands.

Thanks Robin.

Regards

Deepak Cutinha
