> *"fsck" is common to all Unix platforms.*

Oups, sorry, shouldn't be in the path !

> *But still, you have to determine which area of the disk is causing problems (i.e. which filesystem to fsck).*

Yes, you're right, it checks filesystem.

> *Have you rebooted recently?*

The server hung this morning at 3am. The only possible solution to get it up was to reboot it.

The last message I got before it hung, was the one I posted.

I don't if there is a link between this disk Pb and the state of the server this morning... still investigating...

This system disk is mirrored with the 1st one => if it fails, it shouldn't hang the server !

Since this reboot, the message doesn't occur anymore and all the system disk utilities return a successful disk state.

The reboot seems to have solved the Pb, but for how long ?

I'm quite new on the company, but colleagues told me that this server crashes regularly...

Thanks again all.

Rgds
