Dear Admins,

Could you please help to resolve this problem ?

We have a cluster with MC/Service Guard running on it and one of the machines has two packages running and those two packages are using its own oracle instances. Now, when those two packages are down, we found out that shared memory processes or semaphores used by oracle processes are still left out and need to be killed. We could use ipcrm but if only one package is down and the other one is still running in the box, we have no way of knowing which processes(from ipc) are from which package because we do not want to kill those processes that are attached to live package and we only want to kill those processes that are from dead one. Could admins please help me out how to remove those left out oracle processes ?

Thnak you in advance for your help,

-K.Kim-
