Many varied answers

Most popular answer...to set ssh to start from /etc/inetd.conf and then use the inetd.sec to controls

Another one...turn off use sftp completely and use "scp"

>*Original Question: We presently use ssh 3.61 from the HP website on HPUX 11.00. All is secure and well except we need to limit the user that have access to ssh and / or sftp. Before ssh I was able to pick and choose who could telnet and who could ftp or both via client IP address in the inetd.sec file. Is there way to accomplish this with secure shell via IP address or userlogin?*
