Hi all,

We want to configure silkworm 3800 such that a sun machine(E3000 ,HBA Part number-501-3060) can see the array (T3 +) . Even though both array and sun machine are connected to the silkworm switch ,still sun machine can not see the array.

We have configured a zone in the switch which includes port 0 and port1 and those array and the machine is connected to those configured ports( Port 0 and 1).

Is there any other configurations to be done?

San package(SUNWsan) is installed in the machine .

Please advice.

thanks

Manori.
