```

Hi,
When installing iPlanet server onto a test platform for some basic development the install checklist script reports:

ERROR : Only 128MB of physical memory is available on the system. 1000MB is the recommended minimum.

And the install will not proceed.
What is the hidden feature to get around this?

The system will only be used to load and test schemas and LDIF scripts on a Ultra 1/200. We know it will be slow and it is only a test platform.

Thanks....

```
