Greetings,

I had jumpstart configured to install automatically for the last week. I used it this morning, but now when I attempt to reinstall the same client as this morning its dumping to the interactive install. My sysidcfg file has not been modified for over a week. My client has an entry in the rules file. The finish script and profile defined in the rules file exist. ./check reports all is well. /etc/ethers and hosts are good, cause the box is booting.

I have removed the client with rm\_install\_client and readded it with add\_install\_client.

Can anyone give me a suggestion of something I am missing? Is there any way to find out what jumpstart is doing or missing and why its dumping to an interactive install? Why does it not show any error messages on the console?

Thanks,

Drew
