Hello,

I have a SunFire 6800 that is connected to an EMC SAN via Emulex 9002. We had a lun that was 8.4gb under Veritas Volume Manager 3.5. That lun was removed from vxvm, deleted in the symmetrix, and represented as an 80gb lun. I did a devfsadm -Cv and then went into to autoconfigure the drive and I get the error message: Auto configure failed. I am unable to read the vtoc on the drive, it gives the following error message: Unable to read Disk geometry. Is there anything I am missing or should do differently?

Thanks,

Shawn Russell
