To: sunmanagers@sunmanagers.org

hello all,

i'm using rdesktop 1.3.0 to launch a financial application on a sunray from a widows terminal server.

Everything works fine except printing.

We do the same on macosx, with an rdp client which knows how to print on local network printer.

W\$ guys say to me that i can't print from rdestop on solaris. They don't want to install a network printer on their windows server, so i try to find a solution.

Do i need to install samba? it's not installed on my server

Thanks for help, i'll resume

gerard henry
