got an ultra10 with solaris2.8.

seems like SUN display monitor is bad with "no input signal" message. (Green indicator turns to yellow on two ultra10's).

how do i know if m64config or fbconfig is used to configure the graphic card?.

how to re-enable built-in display port with a new NIC or Sony monitor?. just take the graphic card out , reboot it and plug in the SONY monitor into built-in monitor port?.
