Hi,

Does the creation of a nisplus replica server require rsh? I have been trying to add one to my domain. The nisserv script completes fine but the data is not moved to the new replica. rpc.nisd is running on the new replica.

A lsof listing of the network connections shows a connection made to the new replica but nothing actually gets transferred.

The only unusual thing about the replica machine is the fact that I have switched off rlogin, rexec and rsh in inetd because policy is to use ssh for remote logins.

NIS+ master is running Solaris 8

New replica is running Solaris 9

both have the latest patch clusters installed.

Debugging is difficult because if I leave things in this state for more than a couple of minutes, then clients bind to the new server and people can't log in.

Any ideas?

Bob
