Hi All,

I have a "Panic... Couldn't load stub module sched/TS_DPTB "error boot message & I want to solve this by booting to single user & restore the /usr/kernel , /kernel directory structure , however when I create or move directory , I got error message " MKDIR: couldn't create directory : Read-Only file system". Even if I changed the file system & remount with read/write & make sure that I have the / filesystem in read/write mode, I got always that also system is Read-only... Any Work Around???

Thanks & best regards

Amr Shaheen
