Thanks to all that responded esp. to Darren Dunham and another Sun manager that requested to remain nameless.

Actually, the process was reasonably simple to follow.

I simply pulled the disk in question and replaced it with another. The disk span up and the light was stable.

I then did a ...

- Remove a disk for replacement (from vxdiskadm)
- 'vxdctl enable' to pick up the new disk
- Replace a failed or removed disk (from vxdiskadm)

and then waited for the vxrecover process to re-read the Dirty Record Log (DRL). The Disk then went from RCO to ENA using 'vxprint -ht'

Here is a useful link..

Thanks

Andy
