To: <sunmanagers@sunmanagers.org>

Greetings managers,

We had a motherboard fail in our E4500.

Sun's agent came, replaced it, system came up...for about an hour.

Now, we're getting this message about every 10 seconds:

Jan 31 16:42:15 etest unix: WARNING: Could not find hotplugged core system board

and as it was coming down to the OK prompt it said

PROM NOTICE: Board insert detected.

Google doesn't seem to have much to say on the error message.

Anyone ever see this?

The SE suggested to power cycle, which I'm going to do.

Lucky my office moved 12 miles closer to the Data Center.

Thanks

Seth
