Dear All,

I am using a sun solaris 7 server with the HDD mirrored using disk suite.

Suddenly due to some reason ld.so.1 got corrupted and so had to

1. commented out the line
rootdev:/pseudo/md@0:0,0,blk in /etc/system.
2. update the /etc/vfstab and change the entry for /dev/md/dsk/d0 back to /dev/dsk/c0t0d0s0 and reboot the system.

Now the system is up and running. I need to put back the mirroring.

Can any one let me know what is teh best practice from this situation to put back the mirroring.

P S: Now the system is running in only one HDD. So the second HDD is not in sync with the first one.

Regards
Girish
