Hi Gurus,

I downloaded apache-2.0.53 and openssl-0.9.7f source from apache/openssl site and compiled on Solaris 8 and it went through without any errors.

It works fine without ssl but

when I start apache with ssl it gives me following error:

```
# ./apachectl startssl
```

Syntax error on line 251 of /opt/apache/conf/httpd.conf:

```
Cannot load /opt/apache/modules/mod_ssl.so into server: ld.so.1:
/opt/apache/bin/httpd: fatal: relocation error: file
/opt/apache/modules/mod_ssl.so: symbol X509_INFO_free: referenced symbol
not found
```

I used following to compile and install Apache:

```
./configure --prefix=/opt/apache --enable-rewrite=shared
--enable-proxy=shared --enable-ssl=shared enable-ssl
--with-ssl=/usr/local/ssl --enable-mods-shared=all
```

```
make && make install
```

It went fine without any errors.

Does anyone has faced this problem? Do I have to setup LD_LIBRARY_PATH?

Will summarize.

Regards

B
