Thank you all. It is definitely too many to list individually!

1. use "ssh-keygen -t dsa" to generate the id_dsa and id_dsa.pub file in ~/.ssh/
2. scp id_dsa.pub to target computer's home directory
3. chmod 0600 .ssh/id_dsa.pub
4. login target computer, run following command:
cat id_dsa.pub >> .ssh/authorized_keys

in my case, it wouldn't work without step 3.

Thanks again.

Feng
