Dear managers,

we are building C-code on MacOSX, Solaris, Linux,... using gcc. We just realized, that cfsetspeed and cfmakeraw do not exist on Solaris. Does anybody know the corresponding replacements?

On MacOSX we use "#ifdef __APPLE_" to comment out code that does not work on MacOSX. What definition can we use to comment out code on Solaris (e.g. the lines containing cfsetspeed,...)?

Thanks a lot!

Regards,

Andreas
