Hi All,

I use the standard solaris lp printing system. I have two network printers and a solaris print server. There are a couple of client workstations which queue their jobs to the server for printing. Since the past couple of days, the clients are not able to print. However, the print server has no problems in printing. telnet from the client machines to the print server at printer port 515 is also fine. When I send a print job from the client machine and do snoop at the server, I can see the request really coming in. I am wondering why the request is not getting processed. This was absolutely fine until a couple of days back. I request if somebody can enlighten me on fixing this problem.

Thanks in advance
